

Abstract of the Disclosure

An adapter plate to provide a stable supporting transition between the curvature of an exposed log in a log-construction building and electrical components to be installed into the log includes a substantially flat front side, a curved back side, and a center opening. The back side is provided with a smooth curvature complimentary to the curvature of the exposed log surface for snug installation thereto and tracking engagement therewith. The center opening is sized to slidably receive an electrical box into which the component is to be installed. The front side is configured to support the electrical box and for snug installation of the cover plate. The adapter plate is configurable for use with one or more electrical boxes ganged together. The adapter plate conceals the entire electrical box and the space between the component and the log.
